Partner Performance Scorer

AI challenge submission, Rohit Rohinkar. Rules score the partner; AI writes the actions.

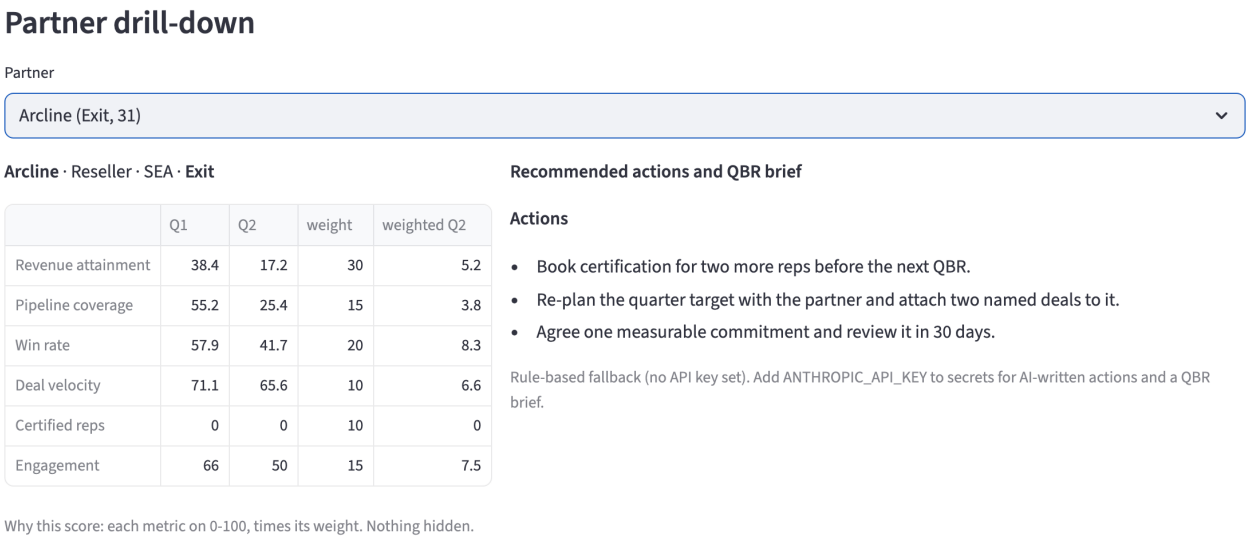

Live app: (Streamlit link)
Code and dataset: (GitHub link)

Summary (100 words)

Partner managers do not trust black-box scores and finance cannot audit them, so I split the job in two. A deterministic scorecard rates every partner on six inputs I have managed in real partner books: revenue attainment, pipeline coverage, win rate, deal velocity, certified reps and engagement. Weights are sliders, so the model is a tool, not a verdict. Score and quarter-on-quarter trend place each partner in Invest, Protect, Fix or Exit. AI only writes three improvement actions tied to the weakest metrics and a QBR brief. Thirty self-generated partners, two quarters. Code, dataset and live app are public.

Portfolio view: weight sliders, Invest / Protect / Fix / Exit, score vs quarter-on-quarter trend, leaderboard.

Drill-down: the planted 'big reseller going cold' story, the metric-by-metric reason for its score, and the recommended actions.

Data is self-generated (30 partners, two quarters). No real companies or confidential information. Built with Streamlit, pandas and the Claude API.
