Partner Performance Scorer

AI challenge submission, Rohit Rohinkar. Rules score the partner; AI writes the actions.

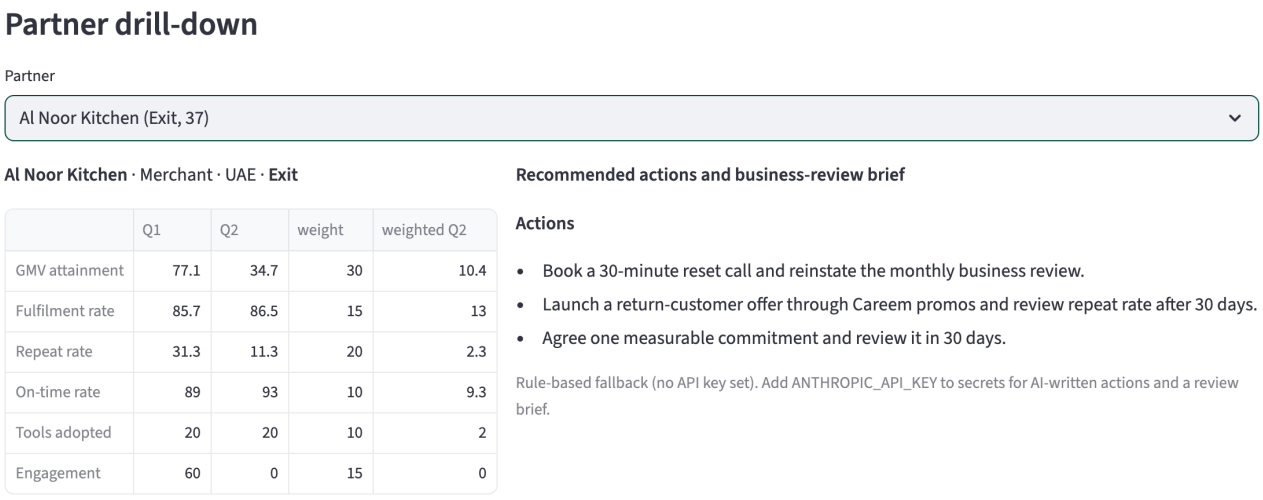

Live app: https://partner-scorer.streamlit.app
Code and dataset: https://github.com/rohitrohinkar/partner-performance-scorer

Summary (100 words)

Partner managers do not trust black-box scores and finance cannot audit them, so I split the job in two. A deterministic scorecard rates every merchant, fleet partner and brand partner on six inputs a Careem partner team already tracks: GMV attainment, fulfilment, repeat rate, on-time rate, tools adopted and engagement. Weights are sliders, so the model is a tool, not a verdict. Score and quarter-on-quarter trend place each partner in Invest, Protect, Fix or Exit. AI only writes three improvement actions tied to the weakest metrics and a business-review brief. Thirty self-generated partners across UAE, KSA, Egypt and Pakistan.

Portfolio view: weight sliders, Invest / Protect / Fix / Exit, score vs quarter-on-quarter trend, leaderboard.

Drill-down: the planted 'big merchant going cold' story, the metric-by-metric reason for its score, and the recommended actions.

Self-generated data, 30 partners, two quarters. No real companies or confidential information. Streamlit, pandas, Claude API.

Approach

The brief asks for an AI that scores partner performance and recommends improvement actions. The design splits that into two jobs with different trust requirements. Scoring is deterministic: six inputs a Careem partner team already tracks, each normalised to 0-100 and combined with weights the user can change. That makes every score auditable and arguable, which is what finance and partner managers need. AI is applied only where language and judgment add value: turning the weakest metrics into three specific actions and a business-review brief the partner manager can take into the room.

Scoring rules

Metric	Scale (0-100)	Weight	Why it matters
GMV attainment	GMV / target, capped at 150%	30	The number the business tracks
Fulfilment rate	completed / received	15	Cancellations cost the customer
Repeat rate	60% returning customers = 100	20	Busy vs. partners customers return to
On-time rate	share within promised window	10	Late is how a customer is lost
Tools adopted	5 partner tools = 100	10	Leading indicator of next quarter GMV
Engagement	review attended 50 + logins up to 50	15	Shows two quarters before GMV does

Quadrants: a score of 60 or more is strong. A quarter-on-quarter drop of more than 3 points counts as slipping; smaller moves are treated as noise. Invest = strong and holding. Protect = strong but slipping. Fix = weak but not sliding. Exit = weak and falling.

AI layer

- For the selected partner the app sends the six normalised metrics for both quarters, the raw numbers and the quadrant to Claude (claude-opus-5-5 via the Anthropic API) and asks for three actions, each tied to a weak metric with an owner and a 30-day measurable, plus a four-sentence business-review brief.
- The score itself never touches the model. The prompt is grounded in the facts shown on screen, so the narrative can be checked against the table beside it.
- The public demo runs the rule-based fallback: a playbook keyed to the two weakest metrics. Adding an ANTHROPIC_API_KEY in Streamlit secrets switches the same panel to AI-written output with no code change.

Data

- Self-generated: 30 partners (15 merchants, 9 fleet partners, 6 brand partners) across UAE, KSA, Egypt and Pakistan, two quarters, GMV in AED thousands. No real companies, no confidential information.
- Four stories are planted so the demo has something to find: a large UAE merchant going cold, a small KSA brand partner tripling GMV, a merchant hitting target while disengaging, and a busy fleet whose fulfilment is sliding.

Build

- Python, pandas, Streamlit (Community Cloud), Anthropic SDK, reportlab for this document. Scoring lives in scoring.py with a unit test; the UI in app.py. About two hours end to end.
- Live app: https://partner-scorer.streamlit.app Code and dataset: https://github.com/rohitrohinkar/partner-performance-scorer
